

I have assumed pi's sclk & lrclk are bidirectional, need to confirm.  
Pi has no MCLK :(

HAT ID EEPROM

CAT24C32 is recommended in HAT design guide  
AT24C32, AT24CS32, and others are equivalent

FreeDSP swaps in/out for master (DSP) and slave (expansion) boards.  
So, lets copy their scheme for now...  
This is the MASTER (hub) connector.

Placeholder for controller.  
(could use external mini Arduino / STM blue pill to start)  
a chip with 2 i2c ports would be best, but not strictly necessary  
only one power port will be required once a chip is chosen (3v3 most likely)

this is not a full crossbar layout, but should be sufficient to test  
(up to 2 inputs and up to 2 outputs)  
added a 5th switch so port 1 could be a DSP loop

another switch connecting 0 to 1 might be useful for DSP testing...
